

Problem Statement: Create a sample web application using MERN stack to capture the loan application process. Web page should contain the tabular form filling process(sample as shown in below screenshot)

or you can be creative and design your own flow apart from tab but it should be good looking and modern UI design.

Each tab will capture following details –

1. Personal details (various form fields like first name, last name, age, mobile no. & other personal details)
2. Business details (various form fields like applicant's business name, GST no, address and other basic business details)
3. Loan Application details (various form fields like loan amount, interest rate, loan tenure etc.)

All the data captured during application process should be saved in Mongo DB.

Make use of states and various features offered by React library.

Code should be clean, with all validations.

Make use of Bootstrap/Material UI or any other standard framework to create attractive and modern design.

Deploy your code on Heroku or any other hosting platform of your choice and share it's link along with github link of your project.
